

# How to enable debug logging for ConfiForms app

In 3 simple steps

1. Go to Confluence administration and find menu item "Logging and Profiling". The direct link would be something like <https://YOURSERVER/admin/viewlog4j.action>
2. Add the following entry

Customise specific logging settings

**Add New Entry**

Class/Package Name	New Level
<input type="text" value="com.vertuna"/>	DEBUG  <input type="button" value="Add entry"/>

```
com.vertuna
```

3. ConfiForms is using the same log used by your Confluence. ConfiForms log entries are from `com.vertuna.confluence.plugins.confiforms.util.ConfiLogger`
