

Using Confluence page properties with Smart Templates

Confluence has an easy way of defining page properties or variables on the page and then building various reports around it, <https://confluence.atlassian.com/doc/page-properties-macro-184550024.html>. **Smart Templates takes this to the New Level** and allows you to connect these properties with variables inside your Smart Templates (with embedded contents) or directly to Confluence Templates (when Smart Template is set to use the Confluence template as a contents source provider)

Sounds complicated? I believe not. Let me explain...

Consider the following contents that needs to be placed on each of you project page:

Smart Templates | hidden = true

Project name	<code>\$projectName</code>
Team size	<code>\$teamSize</code>
Leader	<code>\$leader</code>

Important!

In Smart Templates for Cloud you will need to have your variables put inside the curly braces:

```
${projectName}  
${teamSize}  
${leader}
```

And we want to place it on each project's landing page with actual values and later we want to be able to create Confluence page properties reports with a Page Properties Report macro

On our project page we will add another smart template to reference this one and will add a Confluence page properties macro with actual values

Smart Templates | content = 11862096 | excerpt = vertuna-smart-template#5debb476-385b-44ec-95e7-f723c7569...

Page properties | hidden = true

projectName	ConfForms add-on
leader	Alex
teamSize	3

You see that the values on the left column are exactly matching the names you see in the template from the first screenshot (but without a \$ prefix)

The values from you page properties will be set to a Smart Template result and will render as follows:

Project name	ConfiForms add-on
Team size	3
Leader	Alex

And as the values are set in Page Properties we can then have Confluence to build an automatic report over the data from our space

Edit 'Page properties report' Macro [Help](#)

Label *

In space

[Add a field](#)

Options [Show](#)

Preview

Title	leader	projectName	teamSize
Smart Templates add-on	Vlad	Smart Templates add-on	2
ConfiForms add-on	Alex	ConfiForms add-on	3

[Select macro](#)

As you can see - it is very easy to use Confluence built-in macro called Page Properties with Smart Templates to enable truly dynamic pages.

And there is more! With [How to use Smart templates with ConfiForms](#) you can learn how to make it even more dynamic and alive!
