

How to reference a multi-select user values in IFTTT macro body

Velocity syntax is deprecated, please see [Accessing field values and properties](#) and [Virtual functions](#) for more details on how to access values of multi-select fields

Please use the virtual functions instead, [Virtual functions](#) (from ConfiForms version 1.16+)

Yes, this could be tricky.

The values are actually stored as an array and you should use Velocity foreach loop to get them.

Let's assume that the multi-select user field is named: Requestor (ConfiForms Field Definition's field name)

Then to get the values stored in this field in IFTTT macro body (to create a page or send an email) you will need to do the following:

```
#foreach ($r in $Requestor) $r.fullName #end
```

This will loop all the requestors and output their full names.

Which fields are available for the user object you can see here in more details: [Documentation](#)

But generally for user objects the following fields are exposed:

- fullName
- username
- email

This example is valid for other types of multi-select fields. The only difference is that the values stored inside the field is not a rich object, but a simple text (varchar) value.

So you will reference it's value like this:

```
#foreach ($v in $SomeMultiValue) $v #end
```
