

Using request parameters with Smart Templates

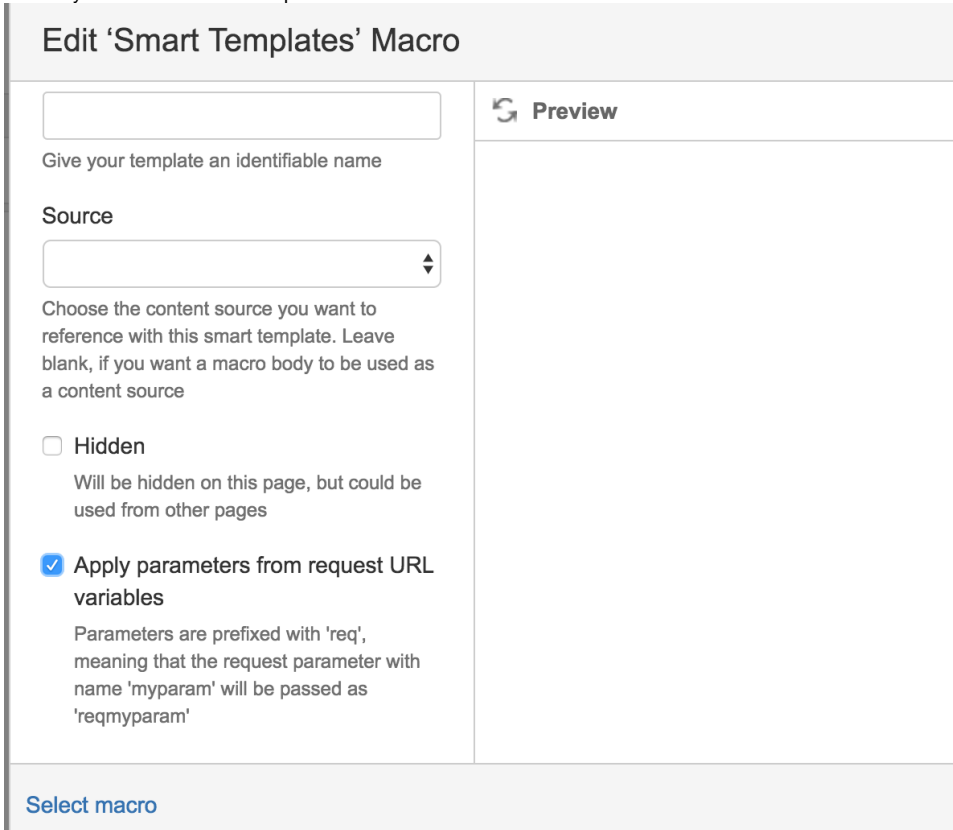

With Smart Templates version 1.2 and newer you can pass variables from request to a Smart Template

Here is how:

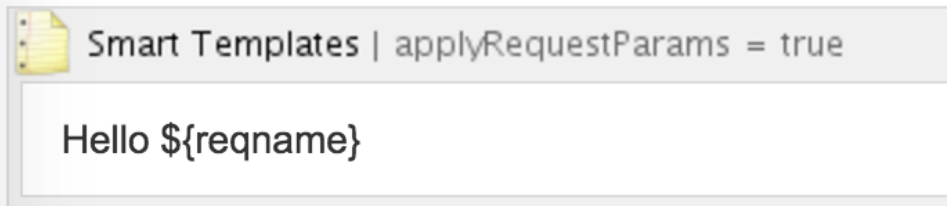

1. Add a Smart Template to you page

2. Ensure you have checked the option

A screenshot of a web interface titled 'Edit 'Smart Templates' Macro'. The interface is divided into two main sections. The left section contains a text input field at the top, followed by the instruction 'Give your template an identifiable name'. Below this is a 'Source' label and a dropdown menu. Under the dropdown is the instruction: 'Choose the content source you want to reference with this smart template. Leave blank, if you want a macro body to be used as a content source'. Further down are two checkboxes: 'Hidden' (unchecked) with the description 'Will be hidden on this page, but could be used from other pages', and 'Apply parameters from request URL variables' (checked) with the description 'Parameters are prefixed with 'req', meaning that the request parameter with name 'myparam' will be passed as 'reqmyparam''. The right section is labeled 'Preview' with a refresh icon. At the bottom of the left section is a blue button labeled 'Select macro'.

3. Then inside the Smart Template you can put something like

4. Then in URL you can do the following

```
https://wiki.vertuna.com/display/ST/Using+request+parameters+with+Smart+Templates?name=John
```

Hello John

5. And this is the result

6. To sum up - variables from request (URL) can be used within the Smart Template and their names are prefixed with "req". A variable "name" from URL becomes a "**`${reqname}`**" in a template

`${reqname}`
