

Conditional validation for required field

With ConfiForms Field Definition Rules it is easy to configure your form to validate the fields to require values, conditionally.

Configuration

You can easily set up the Field Definition to be required via macro parameters

Insert 'ConfiForms Form Field (Definition)' Macro

Field for ConfiForms dynamic forms
[Documentation](#)

Field name *
myfield

Must be unique within the form and can be alphanumeric (contain only latin symbols and/or numbers, no umlauts!)

Field label *
myfield

Required *

Field type
Text

More about each specific field type you can read in the [documentation](#)

Field description (optional)

Select macro

Insert Cancel

But what if you need the field to have a value only when some other field is set?

Consider a simple form with just 2 fields: checkbox field and text field we want to make "required" when a checkbox field is checked

Make required

myfield

+

Confluence editor "view" of the form's configuration

The screenshot shows a ConfiForms Form Definition page with the following structure:

- Outer Container:** ConfiForms Form (Definition) | formName = myform
- Inner Component:** ConfiForms (Form View) Registrations Control | embedded = true
- Nested Component:** ConfiForms Form Field (Definition) | fieldName = makeRequired | ...
- Final Nested Component:** ConfiForms Form Field (Definition) | fieldName = myfield | field...

Now we add a ConfiForms Field Definition rules macro and set it up to require a value for "myfield" when "makeRequired" field is checked

The dialog is titled "Edit 'ConfiForms Rules for Field Definition' Macro". It contains the following fields:

- Field name (or regular expression):** [] (empty)
- Condition:** makeRequired:true AND myfield:[empty]
- Additional Options:** Execute only on user action.
- Buttons:** Save, Cancel

The condition here is set as follows

```
makeRequired:true AND myfield:[empty]
```

The remaining bits of the configuration for the Field Definition Rule are as follows

Action to execute *

Validation rule

Choose the action type to perform, see [more details on each action type in our documentation](#)

Message to show when validation rule matches

myfield requires a value to be set whe

Validation rule

So, we set the **validation rule to run when the condition is met and show the message we have configured**

When we try to submit the form with empty value for the "myfield" when "makeRequired" field is checked we get the following response

The screenshot shows a form submission interface. At the top, there is an error message: "① myfield requires a value to be set when "makeRequired" field is checked". Below this, there is a section labeled "Make required" with a checked checkbox. A field labeled "myfield" is empty. There is a "Save" button at the bottom.

Complete storage format for the demo

            <ac:parameter ac:name="fieldName">myfield requires a value to be set when "makeRequired" field is checked</ac:parameter>
            <ac:parameter ac:name="action">Validation rule</ac:parameter>
        </ac:structured-macro>
        <p>
            <br/>
        </p>
    </ac:rich-text-body>
</ac:structured-macro>

```

Extra step (optional)

We can extend this demo to have a "required asterisk" visible when the field is set to be required

Here is how.

ConFiForms has the required label rendered by adding the following "span" HTML element

```
<span style="color:red;font-weight: bolder;float: right;font-size: larger;">*</span>
```

We can set up couple of rules to add/remove this element via JavaScript

Script is quite simple

```

<script type="text/javascript">
    function makeRequired(formName, formId){
        var myFieldLabel = AJS.$('#' + formId).find('#i_labelfor_myfield');
        AJS.$(myFieldLabel).find('span').remove();
        AJS.$(myFieldLabel).append('<span style="color:red;font-weight: bolder;float: right;font-size: larger;">*' </span>');
    }

    function removeRequired(formName, formId){
        var myFieldLabel = AJS.$('#' + formId).find('#i_labelfor_myfield');
        AJS.$(myFieldLabel).find('span').remove();
    }
</script>

```

And you invoke it via ConfiForms Field Definition Rule called "Run custom JavaScript"

Action to execute *

Run custom JavaScript

Choose the action type to perform, see
[more details on each action type in our documentation](#)

JavaScript to run

`makeRequired(formName, formId);`

Put a valid JavaScript here, which will be

Here is a complete storage format for this configuration
