

# Changing look and feel of the fields in views and in the form

In ConfiForms we try to use the same classes and styles as your Confluence uses. And ConfiForms forms look very native when used on Confluence pages.

However, sometimes, you may want to change the Look and Feel (L&F) of the ConfiForms fields, both when used in "views" and in the form

This task is quite easy if you are familiar with CSS styles, as ConfiForms macros has a parameter to set custom CSS styles as you want. Below you can find couple of examples

Let' change the background color of the Text field on our form.

### Insert 'ConfiForms Field Definition' Macro

names/usernames this field is visible to.  
Leave blank if there are no restrictions

Editable only by groups/users

Comma-separated list of group  
names/usernames this field is editable by.  
Leave blank if there are no restrictions

CSS styles

background-color:grey;

Will be applied on the fields input (If your  
intention is to have a customized output of  
the field, then you need to change a CSS  
on ConfiForms Field macro). To apply a  
CSS class prefix it with class:

Validation rules

Regular Expression to use for fields input  
validation

Preview

Select macro

InsertCancel

The result will be

## Registration

Text Field

Save

Close

What if we want to change some colors or some other styles for the field values, when showing these values in the views

Here is an example of showing the values for the same field in TableView (valid for other views macros, such as: CardView, CalendaView, ListView)

ValueView macro has own CSS parameter which can be used similar to ConfiForms Field and ConfiForms Field Definition CSS macro parameters

Text Field	
Hello World	

For this we use the CSS property of the ConfiForms Field macro

## Edit 'ConfiForms Field' Macro

format given (Example: # ###.00). Expects a compatible pattern, like explained here

### ☐ Show label on own line

To be used when 'Show value with label' is set to true and you need a label to be placed on own line

### ☐ Hide if empty (or used as key only)

Useful, when you do not need to show the field when it does not have a value (in ListView/CardView) or in TableView Merger macro when used as a key-only

### CSS styles

`border: 1px dashed; margin: 5px; padding: 5px;`

Will be applied on the value. To apply a CSS class prefix it with class:

Message to show when field value is empty

### Preview

textfield

Select macro

Save

Cancel

If you are curious the CSS for the above is

```
border: 1px dashed; margin: 5px; padding: 5px; color: green;
```
