## Know your Confluence content

SpaceAuditor is an add-on to the Space Tools in Confluence which analyses and reports on content in the Confluence system, the plugins used (and unused), users, system notifications, and much more. This plugin is an indispensable tool for planning Confluence upgrades, assessing licenses needed for installed plugins, or simply for supporting the Confluence space in daily operations.

### UNDERSTAND YOUR CONFLUENCE CONTENT

<b>Assess space size</b> Analyze the size of spaces in the Confluence system: SpaceAuditor reports space size with and without attachments, tracks pages and their versions, includes trash size, and many additional details about the content in Confluence spaces.	<b>Add-ons</b> To guide upgrade decisions, SpaceAuditor reports on all the plugins and their usage in the Confluence system, ranking plugin use in order to reveal the most heavily used plugins and their associated spaces.	<b>Pages</b> SpaceAuditor provides various metrics for analyzing Confluence pages, including their size, those with the most comments, those with the most contributions, age (as a guide for updating obsolete pages), and many more.
<b>Obsolete content</b> Easily understand which pages are old as a guide for updating obsolete information.	<b>Wiki markup</b> Assess how much of the Confluence content is still in wiki or HTML markup.	<b>Overview</b> SpaceAuditor provides a consolidated view for the content in all Confluence spaces, and these usage reports can be exported for further analysis.

### UNDERSTAND YOUR USERS

<b>Contributors</b> Analyze the activities of space administrators, contributors, and the principal users of your site.	<b>Notifications</b> Explore who is subscribed to blogs, who watches which pages, and check the subscriptions of deactivated users.	<b>Permissions</b> Check permissions throughout your Confluence installation, as well as pages and restrictions set by deactivated users.

## FREQUENTLY ASKED QUESTIONS

- **SpaceAudit times out and does not show the stats...**

For large spaces you will need to increase the SpaceAudit timeout to be able to receive the stats. This is done using the following URL <https://your-confluence-server/plugins/vertuna/spaceauditor/settimeout.action?timeout=1200000&key=SPACEKEY>. The timeout is given in milliseconds, in the example above it is set to 20 minutes
- **Where I can find the SpaceAuditor pages in Confluence?**

Access SpaceAuditor through the Space Administration User Interface in Confluence, typically at the bottom of the left sidebar. Confluence administrators can configure the plug-in for all spaces in the General Administration section.
- **Does SpaceAuditor provide real time data or are the stats based on a system snapshot?**

Real time data is recorded and presented online when you request it. Because data is recorded in real time, the plug-in may affect your Confluence server's performance during the recording process, especially for lower capacity hardware or on systems with heavy loads.
- **Why is SpaceAuditor no longer free?**

We are keenly interested in improving SpaceAuditor, and we have found that offering it for free does not provide us with the feedback and resources we need to develop the plugin further. Like all our products, SpaceAuditor has grown through customer-driven development without which we do not receive new feature requests. Such customer feedback has enabled us to identify new features and to optimise some parts of the add-on to be less resource hungry.
- **I want to gather some stats which SpaceAuditor does not provide. Can you help me?**

Yes, please tell us about it! Send your requests to [vertuna\(at\)vertuna.com](mailto:vertuna(at)vertuna.com)
