

# ConfiForms Filters by example

This is valid for ConfiForms cloud!

This is a page to show how to use [ConfiForms Filters](#) by example

ConfiForms filters is the core component of the app and is used absolutely everywhere where you need to describe a condition, filter the dataset or setup the behaviour (field and IFTTT rules)

In this example we will be more focused on filtering the data, but will also touch the basics of a conditionally applied rules

Let's consider these forms that will, logically, build the bookshelf. Each book can be taken for reading and returned when ready. We will have a form for storing this state and couple of forms to store the data about the book and the author(s)

We have 3 forms

- bookshelf
- books
- author

linked together using smart fields (see how on the right, in data structures section)

So, one **book** may have multiple **authors** and is on a **bookshelf**

## Data structures:

Form: bookshelf									
book	Smart dropdown referencing form "books", and showing "book title"								
status	Dropdown field <table border="1"><thead><tr><th>ID</th><th>Label</th></tr></thead><tbody><tr><td>avail</td><td>Available</td></tr><tr><td>lost</td><td>Lost</td></tr><tr><td>taken</td><td>Taken</td></tr></tbody></table>	ID	Label	avail	Available	lost	Lost	taken	Taken
ID	Label								
avail	Available								
lost	Lost								
taken	Taken								
takeBook	Action button to take the book, sets <pre>status=taken&amp;takenBy=[entry._user]</pre>								
returnBook	Action button to return the book, sets <pre>status=avail&amp;takenBy=</pre>								
takenBy	User								

  

Form: books	
title	Text field holding a book title
authors	Smart multi-select field referencing "authors" form and showing authors last name and first name <pre>[entry.lastName], [entry.firstName]</pre>

Form "books" has an IFTTT rule to "auto-create" a record in the "bookshelf" form when a new book is added

Event \*

onCreated

Choose Action to perform \*

Create / Update ConfiForms Entry

Fire IFTTT action only when this condition/filter is met

If left empty then IFTTT action is always executed when an event is occurred. You can use [entry.FIELD\_NAME] to reference values of the record. [Same syntax expected as in filters](#)

Parameters to set on the entry

book=[entry.id]&status=avail

**Form: author**

firstName	Text field holding author's first name
lastName	Text field holding author's last name
dob	Simple date to store author's "date of birth"
