

Demo for dropdown and apply filter rule to show choices and use of delete rule to prevent deletes when the data is used in another form

This is a demo to show how the dropdown could be filtered using the "usedcount" also counting how many time the name was used

There is also a mechanism used to prevent the deletion of the data if it is used in the other form

Meaning that the form that uses the data from a source form sets the counter about how many times the data have been used. And there is a delete rule on source form to check the "used counter" and fail the deletion of the used count is more than 0

 **Much simpler solution with new function**

[Virtual functions](#) has now a function to query count (*queryCount*) matching your criteria, using this function in the condition of "Validate on delete" rule is much more simpler than implementing the counter and counting the use of values
