

# How to override the width and the height of a form dialog

This form's width is overridden by using the "AJS.params.cf\_formWidth" parameter set with JavaScript on the page

Form's height could also be overridden by using "AJS.params.cf\_formHeight"

Please note, that since 1.54.6 and later version of ConfiForms plugin you can set your own height/width for the form easily within a ConfiForms Registrations Control (FormView) macro, as well as in Edit Controls and the Entry Viewer

**There is no need to hack it with JavaScript!**

This demo is relevant for ConfiForms plugin versions prior to 1.54.6

```
<script>
AJS.params.cf_formWidth = 1300;
AJS.params.cf_formHeight = 400;
</script>
```

It sets the width of the dialog form to 1300pixels and form height will be 400pixels

On this page we use dynamically calculated form height, but set width to 1300 pixels
