

Using ConfiForms Definition Rules to execute custom Javascript to toggle other page elements visible

A form with ConfiForms Field Definition Rule to show and hide the section (div) on the page

Register

Screenshot from the Confluence editor

The screenshot displays the Confluence editor interface for a ConfiForms form. The top section, titled "ConfiForms Form (Definition) | formName = f", contains a "ConfiForms (Form View) Registrations Control | embedded = true" block. Inside this block is a "ConfiForms Form Field | fieldName = toggle | withLa..." block. Below the main form definition, there are two additional blocks: "ConfiForms Form Field (Definition) | fieldName = toggle | fieldL..." and "ConfiForms Rules for Field Definition | actionFieldName = toggle | ...". The bottom section, titled "HTML", contains a JavaScript function for toggling a section's visibility.

```
<script>
function toggleSection(show) {
  if (show) {
    AJS.$('.mysection').show();
  } else {
    AJS.$('.mysection').hide();
  }
}
</script>
```

Storage format for the solution

```
