What does the error - You do not have an authorized access token for remote resource means

When you have an application link between JIRA and Confluence configured to use oAuth2 and would like to use this application link in ConfiForms to create issues or just to show the data from your JIRA inside Confluence you will see the error reported when you try to use this functionality for the first time.

Something like

> ⊘ You do not have an authorized access token for remote resource.

In ConfiForms view macros (when a view has JIRA fields) and in the built-in JIRA macro for Confluence an "authorize service" link is provided, helping you to authorize the access token and start to use this integration (Confluence and JIRA application link)

More about oAuth2 and Confluence/JIRA integration read in Atlassian website
