

How to make labels align correctly when custom layout is used and fields are used with their corresponding labels

When you create a [ConfiForms Form with custom layout](#) forms and would like to use the ConfiForms Fields together with their labels you are quite often have an issues with labels alignment (as labels are of different length)

And you have something like this

my t label:

This is my t1 field:

t2 field:

Save

Close

which does not look very nice...

Using HTML macro

With a simple CSS rule like this

HTML

```
<style>
span[class^="i_holdingrow_"] label {
  width:100px;
  max-width:100px;
  display: inline-block;
}
</style>
```

You can easily fix your layout to be much nicer

my t label:

This is my t1 field:

t2 field:

Save

Close

Using space tools

If you don't have an HTML macro enabled in your Confluence server then you can define the CSS on for your Confluence space

(You need to be a Confluence space administrator)

Go to space tools and select "Look and Feel" "Stylesheet"

Space Tools

Overview

Permissions

Content Tools

Look and Feel

Integrations

Themes

Colour Scheme

Layout

Stylesheet

Slidebar, header and footer

PDF Layout

PDF Stylesheet

You can customize the look and feel of this space by editing the Space Stylesheet. The custom space styles will overwrite all global custom styles and theme styles.

Space Stylesheet

Click Edit to start changing the look and feel.

Edit

And add the CSS style for ConfiForms label (you don't need to put `<style></style>` tags)

Of course you can have alternative styling as you like... for example to make the labels wider.. and to handle correctly user fields you may want to have something like that

My playing with "width" attribute you can make the label take more or less space and align the fields better

You can also align your field's labels to be aligned on top with small addition to the CSS rules mentioned

|

```
HTML

<style>
span[class^="i_holdingrow_"] label {
  width:100px;
  max-width:100px;
  display: inline-block;
  vertical-align: top;
}
</style>
```

```
<style type="text/css">
  span[class^="i_holdingrow_"] label {
    width:480px; max-width:480px; display: inline-block; vertical-align: top;
  }

  span[class^="i_holdingrow_"] span {
    max-width:500px; display: inline-block;
  }

  div[class^="i_holdingrow_"] label {
    width:480px; max-width:480px; display: inline-block; vertical-align: top;
  }

  div[class^="i_holdingrow_"] span {
    max-width:500px; display: inline-block;
  }
</style>
```

Or without touching the width of the whole field

```
<style type="text/css">
  span[class^="i_holdingrow_"] label {
    width:480px; max-width:480px; display: inline-block; vertical-align: top;
  }
</style>
```

Since ConfiForms version 2.16.5 you can use "auto-align" feature that is available in the ConfiForms Registrations Control (FormView) macro

This feature does basically the same thing as shown here, but is built-in
