Hacking ConfiForms ListView macro to show the forms data in Confluence the way you want

ConfiForms ListView is a very powerful tool, as it allows you to mix the content the way you need and and the same time have the context of ConfiForms records available to you.

Here is an idea what is possible:

Assuming you have a form with just 2 fields, you can render a custom dynamic table quite easily, and that is using a mix of HTML and ConfiForms fields

> This approach works for Confluence versions up to 5.9. For later version you should try using the PlainView instead of a ListView and if that doe snot work then trying to create a user macro missing the HTML table headers and footers with a PlainView ConfiForms macro

HTML

```
<table width="100%" class="confluenceTable">
<tr>
<th>Author name</th>
<th>DOB</th>
</tr>
```

ConfiForms ListView | formName = authorsDB | pageTitle = Authors

HTML

```
<tr><td>[entry.author]</td><td>[entry.birthDate]</td></tr>
```

HTML

```
<tfoot><tr>
<th colspan="2">Authors list</th>
</tr>
</tfoot>
</table>
```

In this example we have 2 fields:

- author
- birthDate

And we mix the content in the page to create a table with dynamic rows (taken from ConfiForms form) and then adding the footer

The result is as follows:

Author name	DOB
Theodore Dreiser	Sun Aug 27 00:00:00 EST 1871
Vladimir Nabokov	Sat Apr 22 00:00:00 EST 1899
Leo Tolstoy	Tue Sep 09 00:00:00 EST 1828
Authors list	

Please do not look at the styling (and do not judge too hard), as this cookbook page is not about styling, but about showing you the concepts... Thank you.
