

ConfiForms Form to allow only one entry per user per month

This short tutorial shows you how to setup a form with conditional validation, which allows only one record per user per month

Consider a very simple form with just one field of type "Date", we name it "mydate"

The screenshot shows a configuration window titled "ConfiForms Form (Definition) | formName = f". It contains four main sections:

- ConfiForms Form Registration Control**: A section for registering the form.
- ConfiForms Form Field (Definition) | fieldName = mydate | fieldL...**: A section for defining the field named "mydate".
- ConfiForms Rules for Field Definition | condition = mydate.formatDa...**: A section for defining rules for the field, with a condition set to "mydate.formatDa...".

Just one field and one rule. Everything is in default state, the important bit here is the ConfiForms Rules for Field Definition macro and how it is set up

The screenshot shows the configuration page for the "ConfiForms Rules for Field Definition" macro. It includes a "Preview" button and the following configuration options:

- Field name**: A text input field containing an empty box.
- Condition**: A text input field containing the expression `mydate.formatDate(MM):[entry.my`.
- Execute only on user action**: A checkbox that is currently unchecked.

Additional text below the condition field explains the syntax: "Action will be executed when condition is met. Same syntax expected as in filters. The scope is current entry/record (for dataset validation the scope is all records). You can reference current records fields via [entry.field_name]"

Action *

Validation rule (dataset) ▼

Choose Action to perform

Message to show when validation rule matches

Already exists for this month

Validation rule

Regular Expression to use for fields input validation (when expression matches (or is EMPTY) a message will be shown)

So, we have a rule to run a validation action across the dataset and this will be executed when the condition is met.

The condition is set as follows:

```
mydate.formatDate(MM):[entry.mydate.formatDate(MM)] AND createdBy:[user.name] AND _count:>1
```

We use [Virtual functions](#) here to transform a date field into a month, we use context variable `_count` and we use context variable called `[user.name]` to access the current user login

Alternative way of writing the condition (and more modern), using the context variable `_user`

```
mydate.formatDate(MM):[entry.mydate.formatDate(MM)] AND createdBy:[entry._user] AND _count:>1
```

Complete configuration in storage format is available [here](#)
