Using ConfiForms ListView with Confluence Content by Label macro

ConfiForms ListView is a very powerful macro which allows you to present the data stored within a ConfiForms the way you want, with custom layout and design.

But it also allows you to use any other Confluence macro inside it's body and mis the contents of a ConfiForms Form with anything you like (and not only design and styling).

Here is how you can show the content by Label with ConfiForms ListView, where Content by label macro get's a label property to filter on dynamically from ConfiForms

Live DEMO

We have a form with just one field of type text and that is called "mylabel"

My label

confiforms

There is only ONE record stored with this form at the moment and that is:

- confiforms

Then we can use the ListView macro to be a container for Content by label macro and give the value of our "myfield" to this macro as an input.

What is in the editor

We have a form with just one field of type text and that is called "mylabel"

ConfiForms **ConfiForms Form Definition** | formName = f

ConfiForms **ConfiForms Form Field Definition** | fieldName = mylabel | field...

ConfiForms **ConfiForms (FormView) Registrations Control** | restrictions = sash

ConfiForms **ConfiForms TableView** | formName = f

ConfiForms **ConfiForms Form Field** | fieldName = mylabel

There is only ONE record stored with this form at the moment and that is:

ConfiForms **ConfiForms ListView** | formName = f

- ConfiForms **ConfiForms Form Field** | fieldName = mylabel

Then we can use the ListView macro to be a container for Content by label macro and give the value of our "myfield" to this macro as an input.

ConfiForms **ConfiForms ListView** | formName = f

Content by Label | cql = label = "[entry.mylab...

Some storage format details

We have to use Confluence Storage format editor to inject the reference to "myfield", as it down to allow us to add any arbitrary value in the UI of the macro

```
<ac:structured-macro ac:macro-id="1b53ecf3-505e-4920-969f-5908b09436f4" ac:name="confiform-list" ac:
schema-version="1">
  <ac:parameter ac:name="formName">f</ac:parameter>
  <ac:rich-text-body>
    <p>
      <ac:structured-macro ac:macro-id="e170ca90-0257-4c88-b953-da2a1318d7c6" ac:name="contentbylabel"
ac:schema-version="2">
        <ac:parameter ac:name="cql">label = "[entry.mylabel]"</ac:parameter>
      </ac:structured-macro>
    </p>
  </ac:rich-text-body>
</ac:structured-macro>
```

See the CQL parameter: we have added a reference to "mylabel" field value
